

work is not affected by other people. OneDrive will automatically create a private file. A document will be automatically created for you, and will be saved in the Private Copies folder in OneDrive. If the folder has not been created, OneDrive will create one for you.

Breakout rooms

This new feature is a welcome move from Microsoft. Smaller rooms can now be created for focused discussions while video conferencing. This can be used if managers want to talk to themselves to discuss or make a decision. They can then come back into the main room to announce their decision.

This can also be used when managers want to talk to a person, or a small number of people from the main room before they arrive at a decision. They can then close the breakout room, and announce the way forward.

Protect your data

Organisations do not want their data to get stolen or leaked. When you are working with a large team, files are shared with a lot of computers. As such, the chances of data being stolen or leaked increases. Microsoft has announced sensitivity labels that protect your data.

The way it works is this: there are four labels: Public, General, Confidential, and Highly Confidential. These are applied across office apps. Based on past history, the apps even suggest them.

You can use them to encrypt, watermark, or label content. You can also stop access to unmanaged devices. The protection will be synced across
