

Acquisition by Adobe Systems

After eight releases of Macromedia Flash, Adobe Systems acquired Macromedia in 2005. Since Adobe Systems already had an Adobe Flash Player, they renamed Macromedia Flash to Adobe Flash Professional to differentiate it from their Flash Player. However, initially, Adobe Flash Professional largely used to work in correlation with Adobe Flash Player.

Adobe Flash CS3 was the first release of currently called Adobe Animate under the Adobe Systems brand. From 2007 to 2015, Adobe released nine major versions of Adobe Flash Professional. These nine versions are CS3, CS4, CS5, CS5.5, CS6, CC, CC 2014, 2014.1, and CC 2015. In 2013, Adobe Systems changed the platform's name from Adobe Flash Professional CS6 to Adobe Flash Professional CC as a part of their Creative Cloud initiative. After the acquisition by Adobe Systems, Adobe Flash Professional underwent some significant changes and improvements. The major feature enhancements were largely due to the improved integration with several Adobe software, including Photoshop, Illustrator, and Firework.

ActionScript 3.0 and ActionScript Virtual Machine 2.0 were also released along with the first version of Adobe Flash Professional back in 2007. This helped Adobe Flash Professional with faster code execution. From here on, there were several features added to the platform along with each release. Some of the major features added to Adobe Flash Professional from 2007 to 2015 are:

- Inverse Kinematics
- 3D object manipulation
