

Adobe Flash software was an integral part of the Creative Suite of Adobe Software. It was this suite that really led the domestic use of animation software to the peak. The intuitive design and usability of the software programs made it compatible for both novices and professionals. Even primary schools were now teaching complex subjects like animation to students. After the CS6 generation of the Creative Suite, Adobe transitioned to the Creative Cloud, and Adobe Flash was retained. In 2015, ten years after its association with Adobe, Adobe Flash was renamed as Adobe Animate. This was done in order to reduce its association with the Adobe Flash Player, the use of which was now discouraged to encourage new web-standards based solutions.

Adobe Flash initially focussed exclusively on vector-based animation and thus had a very low capability for scripting, and rather limited interactivity. However, the later versions of Flash, as well as Adobe Animate, have extensive interactivity. Most animation is carried out with the help of buttons and tools. This is due to the use of the ActionScript framework in the new version, which is a variant of JavaScript.

Adobe Animate vs Adobe Character Animator

A software program that is often considered very similar to the Adobe Animate is Adobe Character Animator. Much like Adobe Animate, Adobe Character Animator is also an innovative software. So what makes these two softwares different?
