

interface, you will be able to create impressive vector animations and bit-mapped animations like a pro. Again, the best part is Adobe Animation's versatility to publish your animations. You can export your animations seamlessly on a wide range of platforms, including different animation formats for websites, computers, and apps. Adobe Animate allows you to create animated advertisements, interactive content, games, and cartoons. You can publish these animations on platforms like Flash Player & Air, HTML5 Canvas, WebGL, and custom platforms like Snap SVG. You can make the most effective use of this fabulous animation tool on any PC or mobile device conveniently. By learning to make animations with this tool, you will be able to create animated, expressive content for web, television, and film. It is possible to create eye-catching animations for various modern platforms and web content types.

Getting started

Adobe Animate offers an easy to understand dashboard with numerous tools and functions across the main screen of your document in terms of toolbars. As you open the application, you will see the storyboard asking you the type of documents you would like to create. Choose a document type based on your requirement of simplicity or complexity of the animation.

You can create a document specifically-targeted to various platforms like HTML5 Canvas, Action Script 3.0, and more. Also, choose the type of workplace based on your requirements. Using the Classic workplace is better for simple, basic animations for beginners. Select a desired shape for the animation from the toolbar on your left. You can choose from different shapes based on the ideal screen expected for the platform you are creating your animation. Select the background colour for your screen clicking on the option in the same toolbar on your left. Choosing 'Nothing' will be better for basic, easy-to-create animations. It will be easier to drag away the fill from the border of the shape you draw on the screen.

Initiate your document creation, drawing the shapes choosing from the toolbar. Fill it with the desired colour. Then, convert it to a symbol, clicking on the Modify option on the taskbar at the top. You can name the symbol and choose its attribute as a Movie Clip, which is the most versatile. After converting the shape as a symbol, you can see the same in your library. Again, you can use multiple instances of the same symbol into your animation swiftly. You can also name the particular instance of the symbol going to properties on the top right in the toolbar on your right side.
