User-friendly storyboard

Role of the timeline

The timeline of your document appears horizontally at the bottom of the storyboard. As you play something on the stage, a timeline automatically appears with a keyframe. The keyframe implies any crucial change into your animation. Technically, the timeline holds your frames. The numbers on the timeline do not denote the frames. Yet, they define where the exact frame would go. The sharing within the timeline, corresponding to the frames, is slightly different. The numbers appearing on the scale help you count your frames. So, initially, the timeline with the numbers on the scale is waiting for frames.

You can insert a frame at the desired number choosing the insert option in the top taskbar, and then choosing frame in the subsequent dropdown menu. As you insert the same frame picking up an initial keyframe and then inserting the same frame at the larger number on the scale, you can see the frame lasting longer on the stage. You can scrub the play-head along the timeline to see the frames on the screen.

The default frame rate in Adobe Animate is 24 frames per second. So, 24 frames will play on the stage every second. Remember, to make your animation realistic, maintaining a considerably higher frame rate is essential. You get controls at the bottom to play and pause the animation, navigate to the beginning or the end of your animation film quickly. You can also view the
