

Timeline in animation

timeline clicking on the option available at the top right. You can view the timeline in different sizes choosing different options here like tiny, preview, and preview in context.

Making your images ‘move’

Coming back to the process to create animations, as you create a shape and convert it to a symbol, click on the keyframe, and choose the Create Motion Tween from the dropdown menu. Select a larger frame number on the timeline scrubbing (navigating) the play-head. Now, drag the initially created image on the screen to a different position. Now, as you scrub the play-head from the initial keyframe to the newly selected one, you can see the image moving in the path you dragged the object on some other part of the screen.

Similarly, you can add the third position for the image on the screen, and as you scrub the play-head, you can see the image moving from the first to the second position, then the third one and coming back to the original place by the end, as you have kept the resulting frame the same. In the same way, you can create an animation of a ball bouncing on the ground or any other surface. Now, save the document in the desired folder on your device. So,
