

across the four corners of your screen or stage. The combination of ‘zeros’ on both ‘X’ and ‘Y’ axes, denotes the top left corner of your screen.

Then again, you can also choose the ‘Grid’ option from the ‘View’ menu to see a graph in the background of your animation. The combination of horizontal and vertical lines for all the numbers on the ruler helps you to keep the object in the animation video at the desired focus point. Your animation becomes more engaging and enticing as you choose the right placement of the object, the background, and the other attributes in the animation video.

Another fantastic feature is the ‘Guides’ that you can drag from your rulers and set at the particular horizontal and vertical lines on the grid. Thus, even if you close your ‘Grid’, you can see the ‘Guide’ lines placed at the desired position. Going to the ‘Guide’ option in the ‘View’ menu on the top taskbar, you can change the colour of the guides, and lock the guides in the desired position so that they won’t move till you complete creating the animation.

Choosing the right ‘Snap’ preference is another critical attribute for attaining proper orientation. You can align the objects in your animation in a variety of ways choosing the snap preferences. You can choose to snap align, snap to grid, snap to guides, snap to object, and a few other options to align your objects to the desired attributes on the screen. Now, if you don’t choose the ‘snap to Grid’ option, you can place an object in any desired position, without worrying about the exact integer on the ‘X’ or ‘Y’ axes. It would be, thus, easy to create your animation in a worry-free manner. You can also use advanced edit snap options through the dropdown menu, selecting the ‘edit snap’ option at the bottom of the menu.

Using resources effectively

Adobe Animate Library offers you an exciting range of assets, symbols, and various other attributes to enrich your animations. It is vital to know about the library well and the way it works, to make the most effective use of the available resources in your animation video. The Library Tab is on the toolbar on your right. As you click on the Library Tab, you can see numerous pre-embedded assets as a list.

Get a smaller preview of these assets on the top, by clicking on any of the assets. All the assets have specific icons that you can use in your animation. So, adding creative attributes to your background, around the object, and adding Calls to Action (CTA) becomes very easy if you use these assets correctly.
