Comprehensive Library of Assets

There are many bitmap images imported into the library, appearing as image files. Apart from that, you get various graphics and buttons that you can easily drag and drop into your animation screen to make your animation video look full of life and spontaneous. To add more convenience while organizing these assets, you can create folders in the library and sub-divide the elements based on their types, or even according to your usage frequency of these assets.

It is also possible to open a different library altogether and drag the required assets into your current FLA. You can also pin the particular library and create an all-new library panel for ease in navigation to different assets.

You can edit the library as well by clicking on it and choosing from the available options in the dropdown menu. This menu allows you to look into every detail of all the assets you currently have, organize them for ease in the application while creating your animation, and to update them through a variety of external sources.

So, you would have a secured place to create and store the symbols that you craft, and the assets taken from resources externally. These assets would help you add elegance and value to your animations.
