

Drawing a Face on Adobe Animate - Basic Shapes & Curves

the extreme left, you will see no rounded features at all (i.e., a square face). Alternatively, if you move the slider to the extreme right, you'll get the maximum curvature permissible for this shape.

Drawing and aligning the eyes of a cartoon character on Adobe Animate – (Using the Oval tool)

Right after the face of a cartoon character has been established, the next most important asset in the animation project is to create the eyes of this character. The eyes are an important feature and represent in a variety of ways the basic emotion of storytelling as encapsulated by a particular character. Chronologically, it is always recommended to draw/create the eyes before moving forward with other body parts/shapes because the eyes and their alignment largely dictate the proportions that need to be followed for the rest of the body.

In every iconic cartoon character of the past decade (such as Mickey Mouse from the house of Walt Disney or Bugs Bunny from the Looney Tunes stable), the eyes have played a very important part. In Adobe Animate, the easiest way to draw eyes and assign them to the face you've already created is to use the Oval tool on the right-hand pane.

A very easy fill color to use for the eyes is black. For the light-yellow skin tone that we have chosen for our pilot cartoon character, black provides great contrast. It is important to select a color for the eye that contrasts well against the color of the skin, as used in the previous step.
