

Aligning the eyes of a cartoon character on Adobe Animate

during the duplication process also ensures that both the eyes are already aligned along the horizontal axis.

The eyes can be further highlighted with a “twinkle” representative of the character’s pupils—as this makes the cartoon more realistic and relatable. A “twinkle” or pupil can also be drawn, duplicated, and aligned using the same oval shape tool described in the above process.

Creating the mouth for your cartoon character

After drawing the face and the eyes, the next step is to draw a mouth on your cartoon character. In this tutorial, we will attempt to draw the mouth, too, using an oval-shaped object, and we will use Adobe Animate’s object editing mode to tweak the shape until it resembles a mouth in the most realistic way possible.

You can start with a baseline color of red, which is suitable to represent the inside of the mouth. Once the appropriate fill color has been selected, you can click, hold, and drag the cursor on the canvas to draw a nearly circular shape. After this shape has been drawn, you need to double-click on the shape, once again, to enter the object editing mode. Inside the object editing pane, you can now tweak this circular shape into a mouth (and teeth).

First, you need to use the black-arrow (selection) tool on the right-hand editing pane to select the top half of this circle and hit delete on the keyboard to remove this half. You’re left with a half-moon shape, which is ideal to be
