

representative of the mouth. Once this is done, place (align) this semi-circle within the face that you created earlier, proportionately distant from the eyes. The next step is to select about the top one-third of this semi-circle and change the fill-color to white (on the right-hand editing pane). This will give your cartoon character a set of teeth.

Be sure to adjust the relative alignments (and sizes) of the eyes and teeth in a way that makes the face as realistic as possible. It is very important to maintain these realistic proportions even when you're gnawing away and deleting portions of all default shapes using the object editing mode.

Creating the mouth and teeth of your cartoon character on Adobe Animate

Using the magic selection feature of Adobe Animate to create a “tongue”

The magic of “object editing mode” doesn’t end with the drawing of the mouth. Just like you selected the top one-third of the mouth area and turned it into white teeth, you can jazz up the face a little further by selecting the bottom quarter of the mouth and changing the fill color to pink. This, however, gives you a flat tongue, and we all know that the tongue and teeth are not similarly shaped in real life. This is where the magic of the selection tool really kicks in. All that you need to do to create a realistic and appropriate curvature for the tongue is to click and hold on the line separating the red and pink colors and move the cursor upwards. You will see the line bending with no other effort in terms of manually updating the shape’s properties!
