

Drawing hair on the head of your cartoon character on Adobe Animate - I

far, we've established that we're drawing a brunette! After selecting the fill color, use the Oval tool once again to create a new layer, which should be a circle that's a little bigger than the overall diameter of the face of your cartoon. This is being done so as to keep the possibility of adding natural hair features, such as bangs to the sides of the face.

Once the circle has been created, use the Free transform tool to resize the circle in a way that the diameter of the circle exceeds the diameter of the face. Then, use the selection tool (black arrow) to drag, hold, and select the bottom half of the circle (in the step where we drew the mouth, we selected the top half) and hit delete.

The resulting canvas area should look like this:

The next logical step is to add “bangs” that look natural on the hair and scalp. This “virtual haircut” is made relatively easy by using the “snap to object” feature, which can be enabled by clicking on the inverted horseshoe symbol on the bottom of the editing pane.

To do this, first, double click on the “hair” layer to get into object editing mode. Next, select a small rectangular area on the bottom part of the layer and hit “delete.” Doing this will take out a chunk of hair as a rectangular block. To naturalize this section, enable the snap-to-object feature and then click/drag the edge of the “cut” and move it so that it snaps against the other edge, giving it a triangular shape. The resulting image will look like this:
