

Animagic

Flash was the web standard for making animations. Those of us who were born in the `80s and `90s and even some born in the early `00s have spent countless hours on web forums and flash game websites playing the countless flash games that dominated the internet. For a really long time, online gaming was synonymous with flash-based video games. They were quick, entertaining and mostly transactional. However, as the years went by, Flash became antiquated and turned out to be quite the burden. It slowly became a power hog and running a flash animation on a tab or two on a low-end computer could bring it to its knees. Around the same time, HTML5 and other alternatives started popping up on the horizon. The end of the Flash-era was right around the corner.

While consumer-facing applications of Flash were going down by the day, the animation industry was far from dropping Flash. A lot of studios considered Flash to be the standard for creating animations. There were certainly other capable software in the same space but Flash's legacy was well-established and there was plenty of talent in the market who were proficient with Flash over other tools. But as Flash started getting a lot of flak for security issues, it was time for it to pass. Adobe, who had procured Flash from Macromedia had no intentions of giving up on Flash and overhauled Adobe Flash as Adobe Animate with a clear focus on new-age technologies. In fact, the Adobe Flash player is set to hit end-of-life on December 31, 2020.

Adobe Animate has done a great job of retaining all the things that made Adobe Flash great. It's a very fast software and for folks working in the animation sector, it's an important aspect. And the fact that Adobe's software suite has better integration with each other has only helped with
