In such cases, they are more likely to just represent a top-level interpretation of the motion of that particular portion of the mesh or the skin that it is directly influencing. Finalizing the objectives and processes of design

There are no comprehensive set of rules or guidelines out there that can teach you to create a design that is appealing or attractive. The aesthetics and philosophy of an individual's design language is a highly subjective matter. So long as the creator is sure of their vision and the objectives that they aim to achieve via their animated model, no such concrete rule or parameters can come in the way of them and their project. Finalizing upon the design of your character and object is imperative before you decide to embark upon an animated project of your own. Even though there are no hard and fast rules, creators and animators are generally advised to stick by those designs that are increasingly impulsive and intuitive for them. Doing so allows them to duck the obvious hurdles that creative blocks present and arrive that much more swiftly at their desired destination.
