

quite a distinctive appeal when considered from a stylistic point of view, it presents the hindrance of requiring several states of its constituent elements within the container to its creator. Additionally, when you are making use of this joint, you run the risk of your character's limbs appearing shorter as soon as they bend. It can make them increasingly visually distasteful in the process; some degree of length correction is usually incorporated into the rigging process. Further, one can always implement carefully positioned wrinkles and decorations to conceal the clear visibility of the joints and to make them appear more organic consequently.

The creator and the animator have the liberty to make use of all types of joints while designing their characters and objects.

Structure creation with symbol containers

Once you are done with sketching your creation and defining all the important joints within it, the next step lies in carefully analyzing your creation and indicating the different locations and the varieties of joints that are present in your sketch. Once that is done, the creator is advised to encircle the mentioned specifications and position them with utmost precision at exactly all those spots where the joints are supposed to be. This is done to subsequently convert and transform these marked circles into Graphic Symbols in Adobe Animate, which are then named accordingly depending on what shape they will take in the future of the project. At the end of this entire process, the animator will end up having an empty joint system. It will be, in essence, a shell, that the creator will need to fill up with content in the upcoming stages of the project.

Converting selected elements to symbols

The animator can make use of the following steps to convert the elements of their choice into symbols:

- Select Modify and then click on the Convert To Symbol button.
- Drag and drop the desired selection to the Library panel.
- If you are using Windows, then right-click, otherwise, if you are using a Macintosh system, then Control-click to select the Convert To Symbol option that is present in the context menu.
- Type out the name of the symbol in the Convert To Symbol dialog box that pops up and then pick out the behaviour.
- In order to define the position of the concerned registration point of your symbol, click in the registration grid.
