Rigging the character head

Although rigging the head of your character's body is probably the most time-consuming stage of the project pipeline, as a process, it is actually quite straight forward. The difficulty in this step arises from the fact that every detail in here demands an extreme degree of precision and attention to detail. The fact that human beings are highly sensitive and perceptive of even the slightest nuances that are in play in facial proportions puts the onus on the animator to plot the contour with utmost detail. Care must be taken to ensure that the volumes are absolutely solid and that the subsequent facial and cranial structures are not only well-built but also pack a certain degree of vitality to them. Equal care must be taken while determining the various eye movements of the character, for they play a huge role in defining the personality of the character and making them seem utterly life-like.

The rigging of the head is achieved by first cleaning up all the necessary elements that constitute the head and then subsequently converting them into symbols as you proceed. Once these symbols are defined, different frames are included within those symbols to render variations such as the blinking of the eye, the pouting of the lips, the wringing of the nose and so on and so forth. Usually, the head is played in sync with the main timeline of the project. So it is important that the symbol that designates the head
