

- **Rigging tools** – Animate has rigging tools to develop the animation characters in the video easily. This rigging tool is extremely easy to use.
- **Compositing** – While using Adobe Animate, you have to export the animation suite and use another program to integrate it into a video background and add visual effects.

If you are interested in developing interactive animated elements for your videos, you should go with the Adobe Animate software.

How to work with scenes in Adobe Animate

To organize your video files thematically, scenes are used. For instance, you can choose different signs for a video introduction, credit, or loading message. While using scenes, it is important to avoid managing large FLA video files because every scene has an individual FLA file within it. Using scenes for video development resembles using multiple FLA files to develop a huge presentation. This scene also comes with a timeline, whereas frames in the same document are consecutively numbered through each scene. The scenes in any file playback in the same order as they are listed in the panel. The play head goes to the next scene when it reaches the final frame of the scene. Using scenes for videos might have a few disadvantages and they do apply in very specific situations such as creating heavy animations.

While publishing an SWF video file, every scene's timeline combines into an individual timeline in the same file. Once this SWF file is compiled, it behaves as if the user has created a failed file using a single scene. Because of this mechanism, scenes in Adobe have few disadvantages.

- It forces users to gradually download the entire file even if they do not intend to use all of it.
- ActionScript, combined with scenes, can produce undesirable results.
- It can also result in huge SWF files. using scenes in video in car racer users to place maximum content in a single file that can result in larger SWF files.
- Sometimes it can make the document extremely confusing to edit, especially in a multi-user environment.

Displaying the screen panel – you can select Windows > other panels and > scene.

Add scene – select insert followed by scene and click the add scene button in the available screen panel.

Delete a scene – in the Scene panel, select the Delete scene button
