

Changing the scene's name – you have to double click the name of scene in the panel and enter the new name.

Duplicating a scene – in the Scene panel, click on the placate scene button

Changing the order of scene- in any document, for changing the order of scene you have to drag its name to a new location in the panel

Viewing any scene – you can follow any of the below-mentioned steps-

- In the upper right corner of your document window, Select the edit scene button and choose the name from the pop-up menu.
- Select View > Go To, select the scene name from its sub-menu

Types of animation in Adobe Animate

Adobe Animate offers various methods to create special effects and animation in the video. Each of these methods comes with multiple possibilities and options to create highly engaging animated content. Some of the major types are –

Motion tweens – Motion tweens can be used to set the object properties like Alpha transparency or position in a single frame. Animate also interpolates the values of frames, and motion tweens are crucial for animation consisting of object transformation or continuous motion. The video timeline appears as a frame span that can be used as an individual object by default. Motion tweens are easy to create and powerful.

Classic tweens – Just like motion tweens, classic tweens perform the same functions but they are slightly complex to develop. This enables some particular animated effects but is not possible with the Span based tweens.

Shape tweens – In shape tweens, users can draw any special frame in the video timeline and change its shape to another at a different frame. Adobe Animate interpolates the intermediate shape of the frames in between and creates the animation of any one shape getting morphed into another.

Frame by frame animation – This is an animation technique that allows users to specify multiple frame art in the timeline. It can be used to create a desirable effect in the video frame by playing rapid succession. Frame by frame animation technique is extremely useful for creating a complex video animation in which the graphic elements are different for every frame.

Layers in tween Animation

In Animate, every scene consists of many timeline layers. The layer folders and layers can be used to organize the animation sequence
