

contents along with separating their objects. Organizing the animation content in layers prevents it from getting erased or connected to any other frame when the users overlap the video. To create a video with tween movement of various symbols or text fields, you can place each object in an individual layer. Use any one layer as the background layer to streamline the static artwork in the video and use multiple layers for having a separate animated instance.

While creating a motion tween, Adobe Animate converts the layers having objects you have selected to tween into the same tween layer. In the timeline, the tween layer has an icon next to the tween layer name. If many objects are presented on the same layer under the tweened object, then animate adds different layers above or below the former tween layer. The objects were existing on the original layer below the tweened object move to a different layer below the actual layer and vice versa. To place the frame scripts on a new layer, you can create and drag them to another tween layer. Any frame script can reside in the frame other than the motion tween span. Generally, it is best to keep every frame script on a different player consisting of ActionScript only. When the video document has multiple layers, editing and cracking the document can become difficult. The developers can ease this task after working on the contents of every layer one at a time. You can hide and lock these layers after clicking on the lock icon or eye icon available in the timeline next to the layer name.

Conclusion: Working with scenes in Adobe Animate

The main function of scenes in Animate is to allow users to organize the content. Any timeline spanning various scenes is categorized as a single video is classified as a single unit. This is crucial if the user is working or updating the timeline variable. The scenes cannot be utilized inside the symbol timeline. Scene management in animate encompasses adding or deleting the scenes, renaming, hot changing their order in which they appear in the video. You can easily accomplish this task after following the scene panel options.

To delete any scene –

- Select the scene
- Click on the delete button
- Click ok
