

Whether a professional or novice, young or old, animators require many tools to get their desired thoughts to the computer screen, with tools such as Adobe Animate, you can start with just about anything.

Currently, it is one of the biggest names in the world of creativity. You can use it to create interactive web and mobile content and reach out to people via desktop, mobile, or TV.

Features of Adobe Animate

- **Social Share**

Add title, description, hashtags, and click Share to upload the video directly on YouTube apart from Twitter.

- **Assets Panel**

With the revamped assets panel, you can easily find, organise, and manage assets within multiple tabs.

- **Quick Publish**

Publish your animations to Animated GIF, HTML5, and video with the new Quick Publish option.

- **Advanced Rigging**

The Rigging feature allows you to quickly connect the body parts of a character and manipulate each body part's motions. You can easily drag and drop the rigs from the asset panel.

In this chapter, we'll be looking at how to work your way with audio using Adobe Animate.

Using Audio Splitting in Animate

The audio splitting feature came out in June 2015 and has proven to be incredibly useful. Especially if you're working with longer animations having music or VoiceOver, you may be required to split over different scenes.

Earlier, splitting the audio clip wasn't easy, but Adobe came to import a track and ensure that you can split it up with the program without the need to jump to any other tool.

1. To split the audio on the timeline, you need to set the sound to sync-stream. To do so, select the frame where you want to pause the audio, right-click, and then choose the Split Audio option.
