

Before you import a file, you should create a folder for the sounds in the overall project folder for better organization and place the audio files in the folder in chronological order.

1. To import the sound file, go to the main menu and select File > Import> Import to Library. Select the file or files by holding down the Shift key to choose more and press on the 'Import to Library' option. The items should appear in the library subsequently. Make a sound folder in the library to better organize the project
2. To add a sound layer, first establish a new layer for sound in the timeline and label it as 'Sound.' When you need to insert the sound, insert a keyframe (click on the photo frame and choose the insert keyframe option. After doing this, go to "Properties Inspector" and use the sound pull-down menu. Using that, you can select one of the sound files recently imported to the library.
3. Animate has several ways of synchronizing the sound file with the images, which you will be able to find in the Properties Inspector > Sync option. You should choose Sync > Stream in case of animation projects. It will allow you to scrub the file for lip sync.

Play the right sound
