

Besides compression, there are several ways to use sound efficiently and keep the file size to the minimum :

- Loop short sounds for background music.
- When exporting audio in video clips, remember the audio is exported using global streaming settings present in the Publish Settings dialog box.
- Get more out of sounds by applying various sound effects at different keyframes.

Steps to Animate a Character with the Auto Lip-Sync feature

Save time with Adobe Animate's Auto Lip-sync. It matches the mouth poses to the sounds. Animating characters are great to have and give a chance to the creator to boost audience engagement.

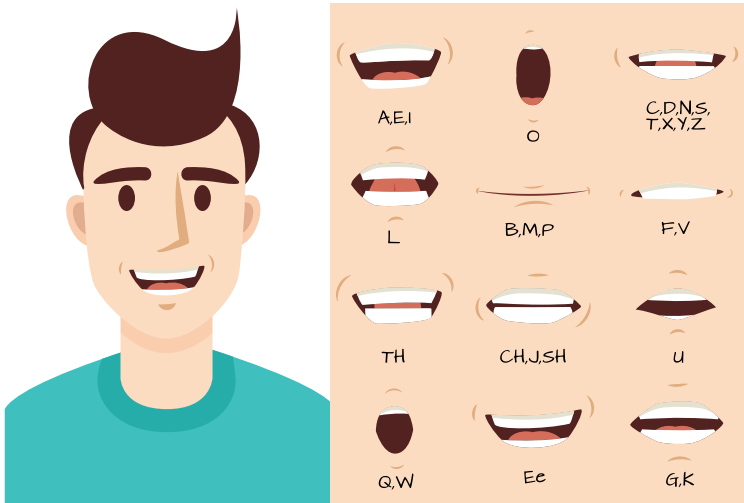

With Adobe Animate, the synchronization of audio is not a strenuous task at all.

With the new lip-syncing features, you can easily synchronize the audio with the character animation, which is useful for the plot's narration.

An animator can use it to add voice to any 2D character.

To get started with the Auto Lip-sync, you need to follow these steps:

1. The first step is to create the mouth shape of the character. A character comprises multiple layers; what you need to do is add mouth shapes and let Animate take care of the rest.

Get the right sounds!
