

2. When you move to the mouth layer, create a master mouth symbol. There is an array of mouth options available such as D mouth, Ah mouth, E mouth, F mouth, L mouth, Oh mouth, R mouth, S mouth, Uh mouth, and W mouth. You will notice that each of them has been labeled, thereby making the process easier.
3. Now, use the available audio and drop the files to the audio layer. Click on the mouth symbol, then move to properties, and at the very bottom, you have the Lip Syncing option. As you click on it, it brings up a panel of 12 sounds. The first sound is neutral. As you click on the next, you can pick the sounds depending on the mouth symbol you've chosen. As each frame is labeled, you can pick the audio layer and Click done.
4. If you have a graphic symbol with all mouth shapers, Adobe Animate can automatically lip-sync.

It is advantageous as you can automatically lip-sync the characters, thereby saving a lot of time.

Steps to Lip-Syncing Using the Frame Picker

Lip syncing the audio with the character can be a tricky business. Let us see how you can use the Frame picker and create keyframes to animate the character.

1. The first step is to import the audio File. To do this, go to File> Import and Import to Library. What it does is, provides control into which layer and keyframe the audio will be placed.
2. When you look at the audio panel, you will see the audio File. In case you are looking for the character to start talking in a particular frame number, say 15, you need to have a keyframe at that moment in time in the audio layer.
3. Get a keyframe by pressing the insert keyframe button located at the lower half of the panel. With the keyframe selected, you can drag the audio file from the library on to the scene. It is always good to have a separate layer for the audio to keep things clean.
4. Now, play your animation from the beginning and listen when the audio starts playing. In case you have a period of silence in between, you can select the audio in the audio layer and click on properties to get the audio sync option. In case you see the sync set on 'Event,' you change it to 'stream.'
5. To start the audio sync process, move to the mouth layer, and open the graphic symbol on the scene by double-clicking on the required area.
