Adding tags to the image

Similarly, tag the other body parts like the ‘neck’ from the head group. If you now click the button ‘add to new scene’, you will find that the image has already started to show some movement because the three tagged points, the neck, waist, and the hip are being made to walk by the Animate. This is just the basic functionality that the Animate displays.

Go back to the Rig workspace for more work. Now, we will start with the legs and start to animate them. You need to use the Staple Tool to staple the legs. It needs to be stapled at the point where the legs are located in the body.

Attaching style and tags for the legs and the arms

Select the group and choose from Attach styles in the Properties section on the right-hand side. Select the Hinge property to give the leg a natural look. We will now add tag handles for the legs. If we are working on the right leg, you need to attach tags for the right knee, right ankle, right heel, and right toe.

Now, take the next leg and repeat the entire process of stapling with the Staple Tool, attach style ‘hinge’, add handles, and finally tag them. The tags for the left leg will be the left knee, left ankle, left heel, and the left toe. The next on our to-do list are the arms. We need to repeat the entire process with both arms. Once the arms are done, you can press the record button to view the character realistically walking.

To work on the arms, select the right arm, staple it to the point where it is connected with the upper half of the body, select hinge as the ‘attach style’ and then add handles to finish the process. Tag the handles to the right elbow and right wrist. Complete the same thing with the left arm – hinge as the ‘attach style’, add handles, and tag them as left elbow and left wrist.
