

Adding attach style to the legs

As mentioned above, now press the record button, see your character displaying full arm and leg movements.

Now, notice the different options of the walk behavior on the right-hand side properties. These properties enable you to make the characters walk more close to real-life. You can choose arm Swing, step speed, body speed, elbow bend, and more, for customizing the walking movement of the character.

Selecting walking styles to make the character move realistically

Now that the arms and legs are all ready to move, you can use different options from the right-hand side properties tab to make the walk movements more real-life like. For example, you can choose from the styles available to make the character slump, strut, prance, sneak, run, or headbang, besides walk. If you observe closely, you will see that the characters still have a very unrealistic movement – a bit rigid or rubbery. To make it more realistic, you need to use the Rig workspace again. First, select one arm or leg. Next, you need to use the Stick Tool to define vertical bones in the arms or the legs. Use the tool to draw a straight and vertical line in each of the limbs – left arm, right arm, left leg, and the right leg.

Now, if you press the record button, you will notice that your character is moving with better structure and flow of motion. You can also make your character walk back and forth. For this, you need to use the Start option to
