Choosing styles besides walk

select 'with left and right arrow keys' and set the body speed to 100 percent. On pressing the right and left arrow keys, you will see that the character goes forward and then comes back to the starting point.

Different kinds of customised walk movements are possible from the properties tab on the right-hand side. You now need to get used to using all of these keys and properties to find the right customized movement for your character. If you need to move the head of the character during the animated walk, you will need to go back to Photoshop and make different profiles – left, right and frontal profiles.

Conclusion

Remember, for each profile, there will be a unique set of head and body combinations. Also, each of these combinations needs to be rigged differently, as has been done here for the side profile. By adding movement to the head, you can create different views that the head can take when the character moves and walks; making it all more realistic. You are now all set to use these features to your character and make storytelling more entertaining. Remember to keep trying and experimenting with different tools and properties of the Adobe Animate to make the entire story more animated and grasping. It will surely take some time for you to master the features of Animate, but it is worth all the effort and time. Bring life to your animated character and sit back to enjoy the amazing responses from your viewers. **d**
