

character to have the animating fun. Changes in the classic tween animation are defined as the keyframe, and in tweened animation, animators define frames at particular stages in the animation process, and Adobe animate creates the frame content. These interpolated frames in the tweened animation project appear with an arrow between the frames because animate saves the shapes in every keyframe and only creates the keyframes at those points that require changes. The animator can edit tweened keyframes and change them directly.
