

are less willing to make a future purchase as a result of the bad experience. In other words, the perceived value of a game determines a gamer's future relationship to the entire in-game economy.

## In-Game Ads

Players are warming up to ads as part of their mobile gaming experience as long as the ads provide some form of in-game items, currency, and boosts. Virtual currency, magnifiers for earnings, and random rewards are often considered the preferred compensation for watching an in-game ad.

The rise of subscription services like Apple Arcade and Google Play Pass shows that a segment of people is willing to pay a fee to forgo ads and in-app purchases altogether.

## Mixed Monetisation Models

When implementing a mixed-monetization model, 65 per cent of developers agreed that ads are complementary to an in-app purchase (IAP) strategy. Rewarded video was used by 79 per cent of developers when using ads as part of a mixed monetisation approach.

Habby has seen the value of a mixed-monetisation approach in their game, Archero. According to Stefan Wang, the CEO of Habby, “By integrating rewarded videos deep into the game design, we’re able to enhance the user experience rather than disrupting the flow.”

eMarketer forecasts that in 2019 US advertisers will spend \$3.25 billion on ads placed within video games across mobile, desktop, and console platforms which is a 16 per cent increase from 2018. Since players will soon be seeing more ads in their games, it's essential for publishers to think about the value that is attached to ad placements and their in-game messaging.

## Communities on the Rise

Gaming communities have evolved with the shifting environments and behaviours of gamers themselves. In turn, the influence of these commu-
