

Live, or Twitch. The quality of the web camera is an important factor for the popularity of their stream. With so many webcams in the market, we are here to help you choose the best one.

The basic features that we must look for in a gaming webcam are -

1. Frame Rate and Resolution

Frame rate refers to the speed of the camera, which is nothing but the number of frames per second. This is the rate at which the images are displayed on the screen. 30 FPS and 60 FPS are the two most popular frame rates in cameras.

60 FPS cameras are a bit expensive and mainly used extensively for studio-grade videos. So, live streamers can choose a 30 FPS camera.

Resolution refers to the number of pixels per frame. The common resolutions available are 480p, 720p, 1080p, and 4K. 4K streaming requires viewers to use ultra high definition displays, and a fast internet connection. Since these features are not commercially available to all viewers, most streamers prefer 1080p streaming only. Hence, a camera with 1080p and 30 FPS or 60 FPS is the right choice for gamers and live streamers.

2. Field of View (FOV)

Field of view is the area that the lens can capture. FOV ranges from 50 to 120 degrees. This is the standard FOV for most web cameras and if you want to capture a wider angle, then choose a wide-angle lens camera.

3. Low Light Quality

Webcams with a high-quality sensor are ideal for streaming videos. You cannot expect perfect lighting every time for live streams, so a webcam that works well under low light is certainly a better bet.

4. Lens

Plastic or glass lenses are used in web cameras as well as DSLRs and mirrorless cameras. It is ideal to opt for glass lenses, as they perform better than plastic lenses in terms of delivering sharp videos.

5. Green Screen Replacement

Some features make a company's product stand out among others. 'Virtual green screen' or 'Chroma Key' is one of them. It is what most gamers love for live streaming on Twitch with their gameplay as the backdrop.
