Gear - Capture Card

Essential for capturing videos from another source

Whether you want to develop a professional streaming setup or share your favorite gaming footage with peers, having a quality capture card will help you record great visuals without impacting the screenplay. With a myriad set of options, you have some capture cards which are suitable for PC gaming, whereas other capture cards align well with consoles. You can also get some cards that will allow you to combine any video feed directly from a camera to your game footage. Think of it as an All-in-One solution for video streaming. Many cards offer impressive features with high definition quality and 4K 60 FPS capture capability.
