

And we're live...

Live Streaming of any form, be it live events or video game streaming, is a major content medium for creators. The gaming industry has seen a tremendous growth and live streaming is a huge part of it. In fact, it was one of the few industries to grow during the ongoing pandemic while most industries suffered setbacks. Clearly, gaming has an immense potential for growth thanks to its diverse nature and enticing appeal. Live streaming, especially for gaming, also shares a similar growth potential. We now have launch-day streams, gameplay streams, retro game streams, competitive eSports streams and a lot more. For folks who are more interested in the personalities rather than the games, there are even IRL(In Real Life) streams.

Setting up a stream is not difficult. Most services have made it a single click process. Just login, click on the “Go live” button and start streaming. So the basics are known to one and all. What isn’t common knowledge is how content creators can improve the quality of their streams. What techniques can one employ and which hardware can one procure for a better stream. Video game streaming is heavily dependent on the game that is being streamed as well and the audience that you wish to develop. Aside from these two major factors, there are oodles of aspects that one needs to consider to improve the quality of their streams. After all, a well-developed channel can easily earn you a proper, or even luxurious living.
