

6. Align your stream with the new features launched by YouTube, Facebook, or Twitch

It is called smart working. The more your stream appears to be aligned with the latest features, the faster it will work. A lot of it is because these platforms work day and night to introduce added features to make your work easy and fast.

7. Looks matter

Okay, this does not mean that you need to be a supermodel and dressed to kill like a celebrity. Ensure that you are comfortable with the entire concept of live streaming; that should show on your face. Plus, look professional – shabby looks do not count. Ensure that your graphics are good and credible.

8. Be spontaneous

Never keep the spark going when playing live. It would help if you are impressive and surprise your audience, which means you should be creative; try new things that your audience may not expect. Yes, it would help if you kept playing the game; after all, your audience is here to see you play. More than that, ensure that you have creative things happening throughout the stream; people will want to come back to see those different things every time.

Pay Attention to the Technical Aspects

The technicalities are very important during live streaming. You can have fun when the set-up is right. So, a lot of stress has to be laid on this aspect. Typically, YouTubers or gamers record their gaming sessions and do not live stream. They feel that the equipment required for the live stream is more high-end and costly than recorded shows. The truth is that one needs to be just a little smarter and get things going.

Live Streaming

1. Hardware

Gamers can choose to stream directly from their console or use a PC. Going in with the former can come with few limitations, but if you wish to make the stream look professional, choose the latter option. Gamers need to find the right hardware set-up to stream while playing the game online. It is because most of your games are hardware-intensive. Choose to speak to an expert before you plan a streaming session.
