

However, in September 2020, Facebook announced that Facebook Gaming Partners would be allowed to play music during their live broadcasts. The only requirement is that the music should be a part of the background, and the streamer's voice should be at the forefront of the video. This was possible after Facebook negotiated deals with major music companies. But, there are still some "restricted tracks" that cannot be played even in the background. Once these are used during a live stream, a pop-up will appear saying that they are not licensed to use it.

Currently, this is only available to Facebook gaming partners, but other users still have access to Facebook's sound collection with free custom music and other sound effects.

Smashcast

A global leader in game live streaming and e-sports, Smashcast helps users stream their gameplays by making an account. The partnership terms and conditions available on the smashcast.tv website clearly state that the platform provides the services of live streaming for video games. But, the platform has the right to place, display, serve any advertisement, branding, or promotional material, before, during or after the live streams. This is similar to most of the video-sharing platforms available.

However, like all other platforms, copyright infringement is not allowed, and it could lead to a loss of revenue. The streamer or publisher has to ensure that their content does not include any third party copyrighted material such as music or video or has the required permission to publish such content.

GosuGamers

A premium e-sports portal, GosuGamers is a global gaming platform with a focus on competitive gaming. The Terms of Service on their website states that the platform has the right to remove any copyrighted content and does not allow their users to modify or copy any of the platform's original copyrighted content. Any live streams of video game gameplays can be legally streamed on the platform.
