

3. Get moderators to moderate your stream.

Though blocking keywords at the backend and chatbots can be helpful for a considerable level of defence. However, they are in no comparison to human intelligence. You will often find clever trolls that would be hard to detect by technology and bring down the reputation of the community's streamer and peace. You can find volunteers to moderate your stream.

Initially, chatbots and one or two moderators are enough. However, once you grow, you need to add more moderators. It is recommended that you must have at least five moderators for every 200 viewers once you start getting more than five messages per second. Setup the rules with the moderators and they will enforce them.

4. Moderating with technology

Twitch utilises a combination of automation as well as human moderators to deal with toxic trolls. It has added more tools for moderators to review and take action against hateful conduct to improve streamers and viewers' experience. The violators of the policies are warned, temporarily suspended and for severe cases banned. Facebook and YouTube have also rolled out stringent guidelines to moderate such content.

YouTube allows users to anonymously flag content for review. And it removes any content that violates the guidelines. These platforms do not tolerate any hate speech against "religion, age, race, caste, gender, disability, ethnicity, sexual orientation, gender identity and expression, nationality, etc."
