

Twitch's Automod utilises natural language processing algorithms and machine learning to identify risky chats and puts them on hold until a moderator views and approves them. YouTube also uses machine learning technology to identify inappropriate content.

Facebook is working on a toolkit and dashboard for video makers and live streamers to quickly manage their audience. They aim to encourage healthy communities and establish rules for the creators, moderators, and the audience. Some of the preset regulations that Facebook is offering are, “be accepting, respect boundaries, no criticism and rude behaviour, no spamming, no self-promotion, and no obscene or vulgar comments. The streamers can choose from a list of specific rules before they go to life and also add a custom description for the audience. The moderators will also be able to remove inappropriate comments in real-time. The new moderation dashboard will prevent harassment and protect the privacy of the creators.

Be careful of live streaming platforms and take complete precautions beforehand to eliminate instances of hateful comments.

Conclusion

Sometimes it gets tough to deal with trolls on live game streaming platforms. Attention seekers enjoy ruining the flow of the live stream and disturbing the creator. If one wants to avoid such instances, it is necessary to create a defence system against the trolls. Trolls often feed on attention and provoke the streamer to react. Common ways in which miscreants troll the streamers are making inappropriate comments, insulting the streamers, stalking them, and more.
