

start using the name of a game that's about to release in the coming months, then that should be a good indicator that they're eager to watch you stream that particular video game. Of course, you will have to sift through the chaff to get to the meat. There will be a lot of memes and garbage coming in the chat and identifying the right keywords requires a good bot. Doing this manually can be quite painful.

A word cloud without all the memes

If you have some experience with programming, then you can set this up yourself. Let's say you're streaming on Twitch. Simply use `tmi.js` (a javascript library) to connect the Twitch IRC protocol and listen to chat messages. Then dump all the words from the chat into a Redis server to perform live chat word ranking and store them. You can explore the word density later or use an GUI to visualise them. Perhaps, you can even make a word cloud and put it up as a widget on your livestream for all the world to see.

Tabletop Game Streaming

Tabletop game streaming is an up-and-coming livestreaming topic. It has its own niche and isn't as mass market as the usual video game streaming but with tabletop games, you can get a loyal audience that will stick with you for years. Through streaming, one can easily share the game playing experience with others and you'll mostly end up having multiple hosts. So people have more personalities on screen that they can relate to. If you have not yet tried this out, why not give it a try?
