AMD Ryzen CPU

- EVGA SuperNOVA GM 450 as a power supply
- Cooler Master MasterBox Q300L for a case
- Windows 10 operating system

The GPU, which will chiefly be utilised for hardware encoding, these are the best cards available for this price point. The build will be sufficient to support games that do not require fancy graphics or high quality textures. The ones which require higher settings can also be streamed on this PC if played at a lower quality.

The CPU and GPU are great steals for such a gaming build as they can easily support demanding games as a unit. If you want to upgrade later, you can simply change specific components, and you will be good to go. But, for a beginner or a gamer on a budget, this streaming-cum-gaming build is perfect.

Solid streaming PC build (approx. ₹80,000)

A stable streaming PC is excellent for streaming games that require higher settings for a better gaming experience and can also handle streams in a more stable fashion. Gamers who are interested in playing more recent video games can opt for this system.

Here are the components that you need to make this solid PC system:

- NVIDIA GTX 1660 Super or AMD RX 5600 XT graphics card
- An AMD R5 3600X CPU
- CoolerMaster HYPER 212 Black CPU Cooler
