

relatively small. If you need to chromakey a full-body shot of a host or a narrator you will need a much larger background.

It's all in the lighting

Also, if you are playing with chromakeying for the first time, before getting into production, you can test the process on a small scale. With an action figure and a sheet of posterboard, you can easily create a practical miniature table-top set. Besides that, extending a sheet of green fabric between two step ladders or painting a small portion of the wall doesn't require more effort.

Many people interchangeably use the words chromakeying and green-screening, but the idea that chromakeying is not limited to the green parts of the light spectrum.

A typical Green Screen set for live streamers

Without adequate illumination, even a professional-quality chroma key wall won't key well. If there ever was a secret to having good keys, then it's all in the illumination. Using soft light, the aim is to illuminate the background as uniformly as possible. Any lighting variation will read as gradient coloring and will confuse your software. And lighting can be more difficult to achieve than you would expect. Hard light sources cast narrow and centered beams in their middle that generate circular hot spots, then fall off quickly, gradually leaving outer portions darker. It helps to shift tiny lights farther away so that larger, soft light beams are cast. .
