

These streamers have some of the best audio and video hardware and software gear that enables them to stream video in 4K 60fps and with studio-quality audio. If you are a streamer, even you would want your stream to look and sound as unique as the content you consume, so that your viewers have the same viewing experience.

This section has discussed methods to improve the stream quality to attract viewership and put some amazing high-quality content out there.

Getting the basics right

What's the first thought that comes to your mind when you talk about improving your audio and video quality in streams? It's investing in high-end peripherals, isn't it? But, that's not necessarily the case. One can improve the streaming quality with some necessary adjustments to your current setup. Here are some such tweaks that can help improve your stream quality.

● Check your upload speed

It is a no-brainer that streaming requires a high-speed data connection, especially with high upload speeds, to have a high-quality stream. Before finalising an ISP, check for the upload speeds provided. ISP usually advertise their download speeds, and upload speeds are less than that. Thus, check for upload speeds as you'll be needing more bandwidth for upload to ensure better quality videos. A good quality stream will usually require the following upload speeds:

- 720p - 6 Mbps (Varies as per platform)
- 1080p - 13 Mbps (Varies as per platform)

If you want to stream your content in 2K, 4K or 8K, you will require even higher upload speeds and the supporting hardware to do so. However, a 1080p stream will suffice for most scenarios.

● Limit your internet usage

Your computer might have different applications running in the background that might be using your network. This can reduce the bandwidth available for your stream and reduce the output quality. Similarly, these tasks might also hog your computer memory, which, in turn, again affect your video capture and streaming setup's performance, and degrade the stream quality. Thus, before starting your stream, make sure that no unnecessary apps are running in the background such as Skype, web browsers, Zoom, etc.
