

Ring light for enhancing visual quality.

or switching between various voice changing ways with the press of a button combination, if you use one. This ensures that you don't waste time going through a long process, and the transitions look seamless. You can use dedicated devices such as the Elgato Streamdeck for this. We've covered the same in a later chapter.

- Secondly, have a good light source, such as a ring light or a hair light to improve the webcam feed and make the stream look better. Ring lights have become hugely popular for video creators in the recent period. However, if you have your setup with already good natural or artificial light, you can skip this step.
- To improve the quality of your audio, you can invest in sound-absorbing panels. These can be installed easily in your streaming room and can help block a substantial amount of outside noise. The most significant advantage of soundproof panels is that they are relatively cheaper and can help absorb decent noise. However, if you live in a noisy neighbourhood, you might want to invest in other costlier soundproofing methods.
- Finally, you need to have a trial run to ensure that everything is working as intended to avoid any mishaps during your stream. Many platforms such as Facebook offer a private streaming mode where you can test different settings and see if everything is working correctly.
