

Introduction

Created by Elgato, Stream Deck is a hardware device. It is also referred to as a physical switcher that allows users to perform actions like pushing a button to switch between the scenes, or change the cameras, mute themselves, or perform any action they want. Stream Deck is not just a regular keypad loaded with fancy buttons, but it is more like a customisable solution that can make your videos easier and highly manageable. It is available in three sizes, and each of them essentially has a mini keyboard. Each key of this keyboard can be customized for showing any icon that the user is willing to take, and they can also precede with any series of actions by pressing the keys. The actions taken by the users are entirely targeted at the streamers so that many integrations can work with the variant tools like control mics, screens, and OBS. However, there are various other integrations such as social media push, media controls, and many more. The basic and most common utility for the Stream Deck tool refers to switching scenes in OBS, toggling mics, playing sound, or triggering any action with other tools such as Twitter.

Stream Deck Sizes

Stream Deck is available in three different sizes, and you can easily get them on Amazon. If you are interested, you can explore all three sizes of this device and learn which one you like the most.

- Stream Deck XL (32 keys)
- Stream Deck (16 keys)
- Stream Deck (6 keys)

Which size you go with totally depends on the amount of functions that you would like to map to the Stream Deck. Also, the Stream Decks support folders so you can pack in more shortcuts within a single folder and get more done with a smaller size.

Before you get started with the Stream Deck, let's look at certain terms -

- Keys - keys are the actual physical buttons present on this device.
- Actions - actions refer to the event that can occur when any key on the Stream Deck is pressed.
- Multi-actions - multi-actions refers to macros that allows users to group various actions all into one. it also refers to the action of triggering one or more than one action with an individual key press
- Profiles - profiles in Stream Deck allude to the key-to-action mappings,
