Elgato Stream Deck: Quick Start Guide

Stream Deck does not come with an array of settings or configurations, but you can go for the general configuration. And the fact that you can share your configurations makes it easy to get started quickly by importing configurations built by other Stream Deck users.

Step 1: Connect Stream Deck

You have to connect the Stream Deck directly to your Mac or PC using a USB port. Keep in mind you should not use a USB hub.

Step 2: Download the Stream Deck app

Download and install the Stream Deck application from the official website.

Step 3: Launch and customise Stream Deck

Launch the application and customise it on your device. For this, check out which action you want from the panel on the right-hand-side of the screen and drag the action and drop it on to the desired key on the left panel.

Step 4: Use custom icons

Now you can configure your actions along with personalising the custom icon keys. Also, use 72 × 72 pixels, .png files, or .jpg files to obtain the best results.

Step 5: Create folders

You can drag and hold any one key over the other for creating a folder.
