

Now tap the back key for an exit, and it will return you to your main configuration page or home panel.

Step 6: Right-click keys for modification

You can right-click the keys to copy, reset, or delete the commands.

Step 7: Use Stream Deck stand

You can prop the Stream Deck device on the stand and adjust its legs for obtaining desired access. Certain Stream Deck devices don't come with an adjustable stand. However, the angle of the stand is quite comfortable to begin with.

Step 8: Social media and More Actions

You can integrate your social media accounts into your device to connect with your fans. You will have to connect your social media handles to the Stream Deck application to enable the API to use Stream Deck's functions. For example, Twitter allows you to Tweet and change the name.

On the bottom of the main UI, you will find a button that reads More Actions. This opens up a whole new set of possibilities. You can pick from several more services which can be mapped to the Elgato Stream Deck. Only the popular ones come preinstalled on the Stream Deck. You can connect your Elgato Wave Link application to connect with your Wave Link 3 microphone. Or you can use a stock market tracker API to track stocks that you are interested in. There's also Visual Studio 2017 and 2019 integration aside from many other features. Elgato also provides the Stream Deck SDK for building your own applications and connectors.

Step 9: Macros

Now that you have understood Stream Deck's configuration, you will be more interested in exploring its multi-actions or macros. You can use these macros to open and close the applications, send tweets, trigger keyboard shortcuts, change the brightness, switch profiles, colours, and perform many other functions. Let us explore some of the possibilities with macros.

- **Day-to-day actions** - Control the music and lights.
- **Pre-streaming actions** - Putting out tweets, or posts on your social media handles before going live. You can have a predefined tweet which reads like this, "Hey, I'm live on Twitch. {Channel URL}". And send it just as you are starting your live stream.
