

Streaming quality videos is based on the following features: the quality of the web camera, microphone, and speed of the internet connection. Even with the best-in-class hardware, you need a good quality broadcaster software that is flexible and configures well with the hardware. You can use ready made solutions with existing hardware but that won't compensate for the nuances of your hardware. Also, using ready-made solutions can hardly make your stream stand out from the rest. Open Broadcaster Software (OBS) allows you to customise several aspects of your stream and is a powerful solution that can make it appear as if you're streaming from a professional studio. If you are using Windows, then OBS is the most popular choice.

Streaming with OBS at first instance may be daunting but with little understanding of the software and troubleshooting methods, you can master it.

Setting up OBS for your hardware:

When you are loading OBS for the first time, you can see the Auto-Configuration Wizard. For those who want to get started up as quickly as possible, you can choose the auto-configuration wizard and follow the prompts. There are many parameters in OBS that need to be configured. Important parameters like recording, encoder, bitrate, resolution, streaming provider,
