

and more need hardware know-how for proper configuration. These settings if configured incorrectly can bring your system to a crawl.

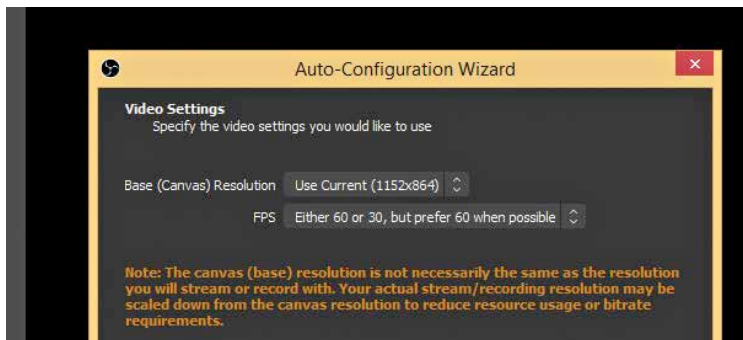

Figure 2: Autoconfiguration wizard setting for the video.

For the first time users, when you're using the Wizard it will try to read the PC's hardware configuration and will request you to choose the video settings and with the resolution and FPS, you can choose the current resolution and 30 FPS as the frame rate.

After selecting the video quality, it will ask for stream information,

You can select your live streaming service from the drop list as Twitch, Youtube, Facebook, restream, or Twitter and provide the stream key.

Stream Key:

The first thing that is required in all accounts is the generation of a stream key. Logging in directly with your credentials is the easiest way.

If you are on Twitch. tv,

1. Login to your account.
2. In the dashboard, on the menu, look for the headers section.
3. Under the header section, click channel and click the stream key.
4. When you click the show stream key option, the key will be displayed.
5. Copy the text and enter the key into OBS.

Now OBS is configured to your channel on just that platform. Here's it's configured for Twitch. You can always generate a new key by logging into the account settings and changing the stream key regularly is a good practice because anyone with your stream key can stream to your channel. OBS supports live streaming on Youtube, Twitch, Facebook or any other platform that provides a stream key. Let's check out the settings for OBS.
