

Advanced output mode:

For more options in the output mode, you can choose the advanced output mode section. Under this section, you have to set the rate control as CBR and keyframe interval to 2. The other setting under this section will be related to the recording of the broadcast. The other settings you can change are best set to “same as stream”, indistinguishable quality, mp4, and x264 formats.

- Recording quality: same as stream
- Recording format: mp4
- Encoder: x.264

Set up audio devices:

Audio devices are very essential to deliver good streaming. There are many audio sources for your system like speakers, headphones, microphones, and other devices. There are options to start, pause or stop them on your PC. To manage these audio devices, use a voice meter. It will enable the OBS to manage your output and disable others. If you suspect that, more than an audio device is turned on, you can verify this under the mixer section, for Voicemeter.

Adding video sources:

OBS will not capture any video in default mode. If you want it to start capturing video, you need a source.

To add the videos to the source,

1. click the “+” button on the sources section.
2. Select your video source from the display.

There are many options to choose from the sources such as Audio input capture, audio output capture, browser, color source, display capture, game capture, image, slide show, media source, scene, text, VLC video source, video capture, and window capture.

If you want to stream your games, click game capture, for sourcing monitor, click window capture.

3. If you are ready for live streaming, click “start streaming”.

Hotkeys:

Setting up different scenes inside the live streaming is possible with the hotkeys. We can set up the hotkeys based on our convenience and switch between the scenes during a live broadcast.
