

3. Name the source to identify from the list.
4. Paste the URL in the URL box of stream overlay.
5. Adjust the height, width, and frame rate of the overlay matching the frame rate and output resolution.

The overlay will appear on the screen. Confirm that your social media links are visible on the top of the stream.

Game streaming with Macbook:

On a Mac, all steps are practically the same.

Troubleshooting tips:

1. For optimising the live stream, try changing the frame rate.
2. Drop the processor load by reducing the output resolution. you can drop from 1080 pixels to 540 pixels.
3. If streaming is still choppy, you can try changing the bitrate, encoder, and other presets.
4. Try demo live streaming with your OBS half an hour before your original live streaming. It will help you to spot the errors in advance.
5. It is always good to add your social media links on the live streaming page. It will increase your socializing factor and drag more people to your channel and business.

Conclusion:

Learning a new technique may sound like a good idea but understanding them is a bit difficult. For enthusiasts who want to learn new things and update themselves, a little reading on the basics and some troubleshooting methods do the tricks. Using any software with many buttons to adjust will be confusing at first and may require extra hands. We are even requested to invest some money for learning them. In those cases, it is always best to use free or open-source software. OBS is one such software that is compatible with all devices.

Learning OBS is smooth and with little experimentation, there will be no problem in navigating the platform. You can also switch from OBS to Stream lab OBS or other broadcasting software easily once you get the hang of all the configurable settings and terminologies.
