

Real-Time Views

- Unique viewers
- Average views per viewer

You also have other kinds of data like the duration the viewers are on YouTube, demographics of the audience, impressions, click-through rate, traffic sources, the relevant search terms that generate viewers for you, views, video subscribers, watch time, retention of the audience, likes and dislikes, end screen reports, top playlists, and more. You can also use third-party tools like Google Analytics or Hootsuite to enhance your audience.

2. Facebook Analytics

Facebook live video can be used to create a loyal audience, but you need the analytics here too, to understand if things are going well for your live streams or not. Performance Insights help you understand the total minutes for which the video has been viewed in the past 28 days.

Loyalty insights help assess the audience engagement, while audience insight enables you to understand where they are coming from and who the viewers are. Similarly, there is retention insight too.

For a live stream gamer, it is the metrics, peak live viewer metrics that help understand peak viewing – when it happens. You can then adjust the content of your live stream accordingly.

3. Twitch Analytics

Channel Analytics helps Twitch live streamers understand their viewers' details and metrics, revenues, and viewer engagement.
