

Blogger Influencer Recording Video

2. Using a capture card

A capture card captures the game from one device and live streams it on the current device. Whether you are playing on a console or on your PC, you need a high-quality capture card to record the video and audio from these devices to play on the streaming PC.

This way, your game performance will not get affected when playing live. There are many options available – internal and external cards with HDMI quality for capturing HD-quality recordings.

3. Display monitors

A gamer must have at least two monitors for an impressive and immersive session in a live session. One monitor can get a bit crowded with too many software programs running on the same PC. With two monitors, one can be used for the game session, and the other for the technicalities related to streaming.

4. Face cam

You get monitors with built-in webcams and lights explicitly made for streamers, or you would need to buy an independent camera and lights. You can choose to go ahead with 720p or 1080p. Ensure that you frame your shots relevantly so that your face is close to the camera.
