FreeBSD Hardware Requirements

FreeBSD installer formats the disk that it is being installed on. Hence, all the data will be lost.

- **Determine an installation location:** You do not need to decide where you will be installing FreeBSD if it will be the only operating system on the disk. However, if you are looking to use the same disk for more than one operating system, you need to partition the disk. The disk on which you install FreeBSD must be empty, or else the installer will format it for you.
- **Collect information regarding your network:** Among the installation methods we will be discussing later, some methods require a network connection. In case a DHCP server is present in your network, the network data will be collected automatically. However, if it is not, you should connect information such as the IP address, subnet mask, default gateway IP address, domain name, and DNS server IP address.
- **Installation media preparation:** You cannot install FreeBSD like a regular application by clicking on an executable file. You need to create a bootable drive by burning the installation files on a physical CD, DVD, or creating a vbootable USB drive.

Initiating installation

How you initiate installation depends on the type of installation media you are using. If you are using a USB drive, have it inserted before the
